UX Artifacts

Personas

A personas artifact represents typical users with real goals, technology skill levels, pain points, and accessibility needs.

Persona Name	Unverified User
Tech Level	Low – familiar with smartphones, not advanced apps
Role	Uploads photos and receives audit reports and forwards them to verified users for confirmation or edits
Goal	Wants the scanning/intake process to be easy, fast, and forgiving of errors
Pain Points	Confusion about which item to scan, needs real-time photo feedback (blur alerts, lighting guidance), cannot directly submit audits
Accessibility	Provide email template, occasional vision problems; prefers large text and high contrast

Persona Name	Verified User
Tech Level	Medium – comfortable capturing and uploading images using a mobile device
Role	needs real-time photo feedback (blur alerts, lighting guidance),
Goal	Quickly upload accurate photos, receive automated audits, and track past reports
Pain Points	Slow Wi-Fi, confusion about which item to scan, needs real-time photo feedback (blur alerts, lighting guidance)
Accessibility	Occasional vision problems; prefers large text and high contrast

Persona Name	Accessibility Auditor
Tech Level	High – proficient with data dashboards and image analysis tools
Role	Reviews flagged images and validates AI-generated accessibility reports

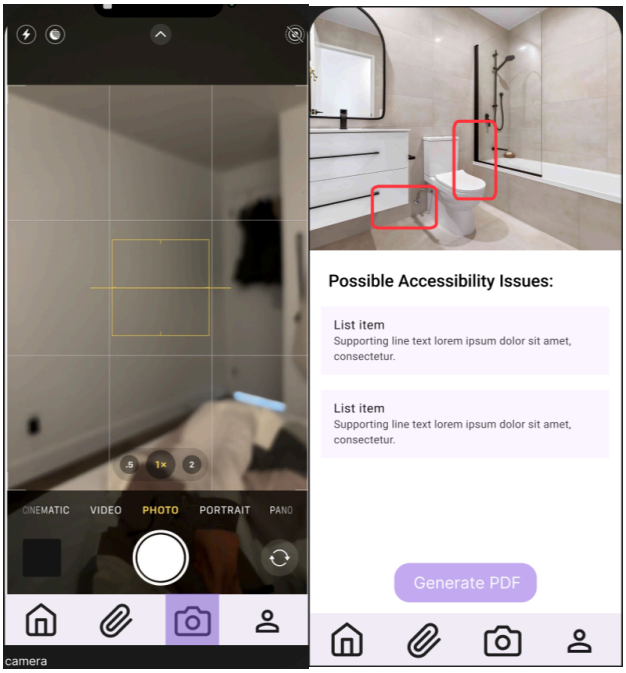
Goal	Ensure detected issues are accurate and reports are actionable
Pain Points	Too many false positives; poor labeling of image regions; repetitive tasks
Accessibility	Color-blind friendly interfaces; clear separation of data panels

User Journey Map

Unverified User: Requesting an Audit

Unverified User opens the app → selects the photo icon → capture images of the facility (e.g., washroom) → system auto-checks image quality (lighting, blur) → user receives an automated Audit Report → clicks share with accessibility auditor → app generates an email template → user sends this from their email → auditor receives and confirm or edit audit results → receives confirmation once revisions are complete.

Edge Case:
If upload fails (poor internet), the app queues the submission and shows a progress reminder banner: “Upload pending… will retry when connected.”

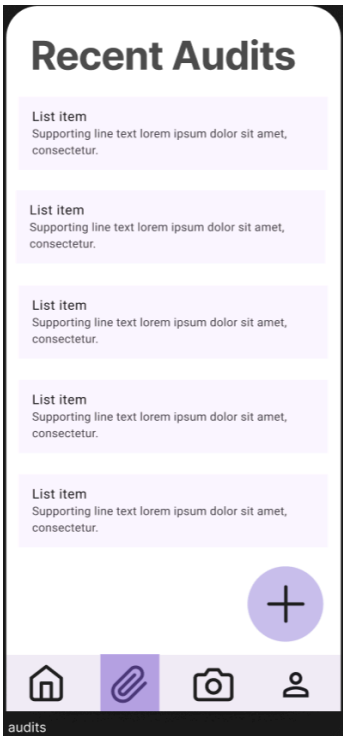


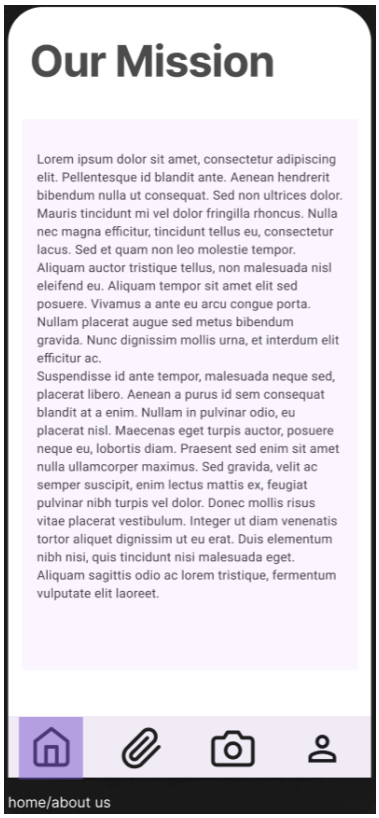
Verified User: Submitting and Managing Audits

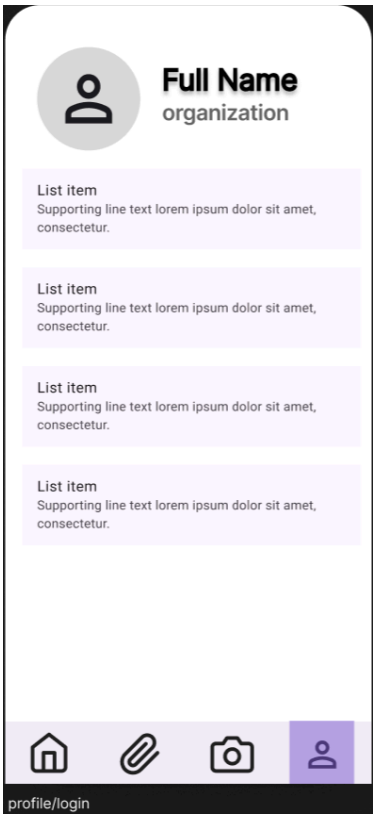
Verified User opens the app → logs in → selects the photo icon → captures images of the facility → system auto-checks image quality → user receives an automated audit report → user reviews flagged items → user saves the audit → optionally builds or updates a facility blueprint → share finalized audit with auditors → receives confirmation once revisions are complete

Edge Case:
If a photo fails validation, the app prompts: “Could not detect key features. Please try again.”

Accessibility Auditor: Reviewing and Verifying Reports

Auditor opens audit dashboard → filters reports by location, date, or submitter type → selects flagged audit (low-confidence results) → views images, AI annotations, and compliance scores → corrects mislabeled detections → confirms true violations → mark audit as verified → shares final report with verified and unverified users






Edge Case:
If the system misclassifies a key feature (e.g., grab bar detected as towel rack), the auditor can draw a bounding box and label it manually for model retraining.
